The Business Challenge

Every recruiter on a job looks the same to the system — and it's costing teams time

Enterprise talent teams staff a job with several kinds of recruiters — a lead recruiter, supporting recruiters, sourcers, and coordinators. Today the platform collapses them all into one "Recruiter" role, so notifications, workspace views, and ATS sync can't tell them apart.

The problem today

- **Notification fatigue & duplicates** — everyone gets every alert, and a person holding two roles on a job is notified twice.
- **Undifferentiated "My Jobs"** — jobs where a user only supports clutter the same view as the jobs they actually lead.
- **Lost ATS fidelity** — the ATS already distinguishes sourcers and secondary recruiters, but the platform flattens them into "Recruiter."

What the business is asking for

- Recognise distinct recruiter-family roles on the hiring team.
- Route notifications by role and send exactly one alert per event.
- Focus "My Jobs" and filters on the role that matters to each user.
- Preserve the ATS's granular roles when a job is pulled in.

MVP · Roles

New recruiter-family roles

Phase 1 adds recruiter-family roles, each switched on per tenant by admin configuration. **Sourcer** and **Recruiting Coordinator** become new top-level roles; **Secondary Recruiter** sits under Recruiter.

LEADING

Primary Recruiter

Today's Recruiter. Owns the job — "My Jobs" keeps showing only where the user is Primary Recruiter.

SUPPORTING

Secondary Recruiter

A child role under Recruiter for additional recruiters on the same requisition.

SUPPORTING

Sourcer

New top-level role for sourcing specialists, with its own job spotlight.

SUPPORTING

Recruiting Coordinator

New top-level role for scheduling and coordination on the job.

MVP · Configuration & CRM

Admin-controlled, role-aware CRM

Configuration & assignment

- Each role is enabled or disabled **per tenant by an admin** — separately for Secondary Recruiter, Sourcer and Coordinator.
- Roles can be associated to a job **before it is published**.
- Only the **Primary Recruiter** adds users to these roles; assignments stay editable after publish.

Views, spotlights & ATS

- Each enabled role gets its own spotlight — "Sourcer Jobs", "Secondary Recruiter Jobs", "Coordinator Jobs"; "My Jobs" still lists Recruiter jobs.
- Existing filters and advanced filters work **as-is** for the new roles.
- Roles configured in the ATS create **placeholders** in CRM — filled manually by admins / Primary Recruiter in MVP.

Guardrail: once a job has a user assigned to one of these roles, that role's setting can no longer be turned off.

MVP · Notifications

One person, one notification

Exactly one email

Even when a user holds multiple roles on the same job, only one email notification is sent per event.

Last-held-role context

Notifications reflect the most recent role — a Recruiter later made Sourcer receives Sourcer notifications, not Recruiter.

Inherited settings

Notification preferences are inherited directly from recruiter-level settings.

Not in MVP: SMS / WhatsApp delivery and per-role personalization.

MVP · Reports & Analytics

Visibility into every role's contribution

What's planned

- Reporting is enabled per the roles a user holds on jobs, so their activity can be **analysed by role**.
- Primary Recruiter reporting capabilities are **cloned** for Secondary Recruiter, Sourcer and Coordinator.

In practice

- A user who is both Secondary Recruiter and Sourcer can be reported on **separately for each role**.
- Leaders gain a clear view of each role's contribution to a requisition.

MVP · Delivery

When Phenom can deliver the MVP

Now

Grooming & Design
Scope, UX and cross-team effort being finalised.

Date TBD

Build
Engineering across CRM, Integration & Messaging.

Date TBD

UAT — Staging
Customer validation on the agreed rollout tenants.

Date TBD

Go-Live — Production
Enabled per tenant after ATS role mapping is validated.

Dates to be confirmed — the epic is currently in grooming.
